Hello there, I am Sergi Magret, a 21-year-old Computer Engineering student. I have been combining the studies with a part time job at Telepizza Figueres for more than two years now.

Since last year of Secondary School when I did my first web page with HTML and CSS for Technology class (it is in Catalan, but you can find it here) I have known that I want to study this career. Since that moment until I started the career, I never stopped doing some small projects, like a basic calculator in Python or another web page. For the final project of 2nd of bachelor, I developed a small executable in C++ which encrypted sentences and words via the Caesar cypher method and an explanation of the evolution over the years about the cryptographic methods used from the Scytale used by the Spartans to the modern methods like AES, DES, RSA, public and private key... (It is also in Catalan, but you can find the pdf here).

After that I entered the Computer Engineering career, with this degree I have learnt a lot in a big variety of languages and disciplines, from C++ to Java, from Assembly to Python, PHP,… You name it, we have touched almost every classic language. We have also done parallelism, networking, calculus, logic, some physics… If you want to know the exact subjects and plan of studies we take in the degree you can check it here.

During the career and in my part time job, I have learnt what I think is an especially important skill, working in group, from the first day we have done practices in groups, either with couples, or groups of 4, 5 or 6 people. I have always adapted well in all the group projects I have participated. Another aptitude I have learnt is to organize myself, in the degree I have to organize the time properly to deliver every project in time, and at the job because I have to develop two or three tasks at the same time.

My other big hobby other than IT is music, I spend almost the entire day with music in the background. In my free time when I am not studying or working, I like to exercise, watch TV shows or movies, hang out with my friends... Other than that, I am continuously reading about technology, trying to keep updated in this world that advances so fast, I use Feedly, where I have a series of subscriptions to webs and blogs which talk and inform about the latest news in every field.

I would define myself as a persistent person, who never rests until accomplish what I propose, patient, because sometimes accomplishing this objectives can take a while and perfectionist because I believe that if you do something you have to do it right, and with a professional end-look, to leave it half or badly done its better not to do it, even though sometimes being that perfectionist plays against me as well, because there's times when you have to accept that what you have done is the maximum you can achieve.

If you have any doubts, want to know more about something or just want to chat, do not hesitate to contact me at sergimagret.github.io.
